

Enteral Feeding Syringe

Enteral Feeding Syringe

- Made of Medical grade PP, latex and DEHP free
- The tip of the syringe is different from injection tip, which minimizes misconnection and medical fault.
- Distinguished Orange/Purple alerts medical stuff
- Proprietary shape of protective cap: assures correct positioning for re-capping when the syringe is filled
- Seven standard sizes from 1ml to 60ml for option
- Compatible to leading feeding pumps in the market for accurate speed and dosage control.

Enteral Feeding Tube

Feeding Tube is used for those individuals who are unable to ingest nutrients by mouth. It is placed in either nostril, passed down the pharynx through the esophagus and into the stomach and is generally used for a short while or permanently feeding (usually only 2 weeks maximum), for the treatment of acute conditions or lifelong in the case of chronic disabilities.

Made of Medical Grade PVC/Silicone/PU, reduces the incidences of nasal discharges.

Distinguished Orange: reminds medical staff not to use as intravenous tube.

Radiopaque Line shown well on x-ray allows the clinician to easily determine the distal tip location.

Depth Markings provide guide to proper placement.

Integral Cap can be closed when it is not in use or transport.

Lateral Eyes maximize flow rates for less clogging.

Weighted Tip facilitates ease of insertion into an unconscious or poorly cooperative patients or one with a hypersensitive gag reflex.

Universal Connector is incompatible with a wide variety of feedings for reducing the risk of accidental connection or infusion.

Sterile, Individual Peel Pouches minimizes risk of cross-contamination.

Available in Enteral safe and ISO80369 compatible connections.
